Fundamental Concepts Covered in the Worksheet

What Are Bacteria?

Bacteria are single-celled microorganisms classified as prokaryotes, meaning they lack a nucleus. They are among the earliest forms of life on Earth and play vital roles in various

ecosystems.

Characteristics of Bacteria

1. Size: Typically 0.2 to 2 micrometers in diameter
2. Structure: Composed of a cell wall, cell membrane, cytoplasm, and genetic material
3. Reproduction: Mainly through binary fission
4. Metabolism: Diverse, including aerobic and anaerobic bacteria
5. Roles: Some are beneficial (e.g., gut flora), while others cause disease

What Are Viruses?

Viruses are tiny infectious agents that require a host cell to replicate. They are not classified as living organisms because they lack cellular structure and metabolism on their own.

Characteristics of Viruses

1. Size: Usually 20 to 300 nanometers
2. Structure: Consist of genetic material (DNA or RNA) enclosed in a protein coat called a capsid
3. Reproduction: Invades host cells and hijacks their machinery
4. Metabolism: None independently
5. Roles: Causing diseases like influenza, HIV, and COVID-19

Differences Between Bacteria and Viruses

Structural Differences

1. Bacteria are cellular with all necessary components for life; viruses are acellular.
2. Bacteria have a cell wall, membrane, and cytoplasm; viruses have only genetic material and protein coat.

Reproduction and Life Cycle

1. Bacteria reproduce independently via binary fission.
2. Viruses depend on invading host cells to replicate, often causing the cell to burst.

Living or Non-Living?

1. Bacteria are considered living organisms.
2. Viruses are considered non-living entities outside of host cells.

Impact on Humans

1. Bacteria can be both beneficial (e.g., antibiotics production, digestion) and harmful (causing diseases).
2. Viruses are primarily pathogenic, responsible for many infectious diseases.

Overview of Bacteria and Viruses

Before diving into detailed features of worksheets, it's important to distinguish between bacteria and viruses, two of the most studied microorganisms.

What Are Bacteria?

Bacteria are single-celled organisms classified as prokaryotes, meaning they lack a nucleus. They are incredibly diverse, inhabiting virtually every environment on Earth—from soil and

water to the human body. Bacteria play dual roles: some are beneficial (like those aiding digestion), while others can cause diseases such as strep throat, tuberculosis, and urinary tract infections.

What Are Viruses?

Viruses are much smaller than bacteria and are considered acellular entities. They consist of genetic material—either DNA or RNA—encased within a protein coat called a capsid. Unlike bacteria, viruses cannot reproduce on their own; they depend on infecting host cells to replicate, which explains their role as pathogens. Examples include influenza, HIV, and the coronavirus responsible for COVID-19.
