Sample Probabilistic and Stochastic Calculus Questions with Solutions

Question 1: Brownian Motion and Its Properties Q: Define standard Brownian motion and list its key properties. A: Standard Brownian motion (W_t) is a stochastic process with the following properties: - $(W_0 = 0)$ almost surely. - Independent increments: For $(0 \leq s < t)$, $(W_t - W_s)$ is independent of $(\{W_u : u \leq s\})$. - Stationary increments: $(W_t - W_s \sim N(0, t-s))$. - Continuous paths: (W_t) is almost surely continuous in (t) . Question 2: Itô's Lemma Application Q: Given $(X_t = \exp(\sigma W_t + \mu t))$, use Itô's Lemma to find the SDE satisfied by (X_t) . A: Applying Itô's Lemma: $[dX_t = X_t \left(\mu dt + \sigma dW_t + \frac{1}{2} \sigma^2 dt \right) = X_t \left(\left(\mu + \frac{1}{2} \sigma^2 \right) dt + \sigma dW_t \right)]$ Thus, the SDE is: $[dX_t = X_t \left(\left(\mu + \frac{1}{2} \sigma^2 \right) dt + \sigma dW_t \right)]$

Deep Dive into Key Topics and Typical Questions

To prepare effectively, it's crucial to understand both the theoretical underpinnings and practical applications of probability and stochastic calculus. Below, we explore some of the most common areas of focus in interviews.

Probability Distributions and Their Applications

- Normal Distribution: The backbone of many financial models; understanding the properties of Gaussian variables is essential. - Log-normal Distribution: Used for modeling stock prices; since $(S_t = S_0 e^{(\mu - \frac{1}{2}\sigma^2)t + \sigma W_t})$, understanding its derivation and properties is critical. - Poisson Process: Models jump events like defaults or sudden shocks; key properties include memorylessness and independent increments. - Application in Quantitative Finance: Deriving option prices, risk measures, or simulating asset paths often involves these distributions. Sample Question: Derive the distribution of the maximum of a Brownian motion over a fixed interval.

Itô Calculus and Its Applications

Itô calculus is perhaps the most nuanced aspect of stochastic calculus tested in interviews. - Itô's Lemma: The fundamental tool for changing variables in stochastic processes. Question: Use Itô's lemma to find the differential of $(Y_t = \ln S_t)$, where (S_t) follows a geometric Brownian motion. - Itô Isometry: Simplifies calculations involving stochastic integrals; useful for computing second moments. Question: Show that $(\mathbb{E}[\left(\int_0^T \sigma_s dW_s\right)^2]) = \mathbb{E}[\int_0^T \sigma_s^2 ds])$. - Applications: Deriving the Black-Scholes PDE, constructing hedging strategies, pricing derivatives.

Stochastic Differential Equations (SDEs)

SDEs model the evolution of quantities like stock prices, interest rates, or volatility. - Explicit Solutions: For example, the geometric Brownian motion SDE: $dS_t = \mu S_t dt + \sigma S_t dW_t$ has the solution: $S_t = S_0 \exp\left(\left(\mu - \frac{\sigma^2}{2}\right)t + \sigma W_t\right)$ - Questions: - Derive solutions of linear SDEs. - Identify the distribution of (X_t) given the SDE parameters. Sample Question: Solve the Ornstein-Uhlenbeck process SDE and interpret its mean-reverting property.

Model Calibration and Estimation

In practical scenarios, you may be asked how to fit models to data. - Maximum Likelihood Estimation (MLE): For parameters of Brownian motion, Ornstein-Uhlenbeck, or CIR models. - Method of Moments: An alternative when explicit likelihoods are complex. - Bayesian Methods: Updating beliefs about parameters based on observed data. Sample Question: Given historical log-returns, estimate the volatility parameter assuming a Brownian motion model.

Advanced Topics and Special Cases

Quant interviews often push applicants to demonstrate knowledge beyond basic concepts.

Jump Processes and Lévy Flights

- Incorporate sudden, discontinuous changes in asset prices. - Poisson Jumps: Model rare, significant events. - Questions: - How do jumps alter the pricing of options? - Derive the characteristic function of a jump-diffusion process.

Stochastic Volatility Models

- Models like Heston or SABR introduce stochastic processes for volatility itself. - Questions: - Derive the joint dynamics of asset price and volatility. - Discuss implications for implied volatility surfaces.

Measure Changes and Risk-Neutral Valuation

- Transitioning from the real-world measure (P) to the risk-neutral measure (Q) is fundamental. - Girsanov's Theorem: Allows changing the drift of Brownian motion under measure change. - Questions: - Derive the Radon-Nikodym
